

Quick Case Study: Distributed Calls in Elixir

Start an Elixir shell:

```
iex --name alice  
  
defmodule Hello do  
  def world do  
    IO.puts "Hello World"  
  end  
end
```

Start another command prompt or shell.

```
iex --name bob  
  
Hello.world()    # leads to error, of course  
  
Node.spawn("alice@zenbox.local", fn -> Hello.world() end)  
  
# Make sure you change the identifier according to the one shown in your first shell
```
