

## Set Up Elixir on Windows

Download the installer from <https://repo.hex.pm/elixir-websetup.exe>

Install it using the wizard. All the default should work fine.

It might ask you to install some .Net redistributables. Just go ahead and click ok on that as well.

## Running Elixir

Now that we have elixir set up, let's make sure it's working correctly.

Open up the command prompt.

```
# Getting started with Elixir.  
# Just type:  
# iex  
# to enter the interactive shell
```

And here's the hello world for it!

```
I0.puts "Hello World!"
```
