Set Up Elixir on MacOS

If you don't already have homebrew (https://brew.sh), install that:

```
/usr/bin/ruby -e "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/master/ins
```

Then, go ahead and install elixir using that:

```
brew install elixir
```

Running Elixir

Now that we have elixir set up, let's make sure it's working correctly.

```
# Getting started with Elixir.
# Just type:
#      iex
# to enter the interactive shell
```

And here's the hello world for it!

```
IO.puts "Hello World!"
```
